2. The current application concerns a method (claim 1) for transmitting data in a radio communications system, in which a shared channel is provided, said channel being allocated to a plurality of subscribers at the same time for transmitting data between a base station and the subscriber station of each subscriber, measurements being taken with regard to transmission quality on the shared channel, the results thereof being available in the base station and the base station transmitting a first message to an associated controlling radio network controller, said first message containing information about transmission quality.

3. A similar method is disclosed in document D1.

Box No. V	Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
	<p>claim 1 and that of document D1 is that the base station transmits a first message to an associated controlling radio network controller, said message containing information about transmission quality as well as about subscriber stations for which poor transmission quality has been detected, only if the measurements show that the transmission quality does not meet a predefined criterion.</p> <p>5. The above features solve the problem of reducing signalling complexity between the base station and the controlling radio network controller.</p> <p>6. The novel feature is neither suggested by any of the documents cited in the search report, nor is it part of common general knowledge in the field of mobile communications. The application therefore meets the requirements of PCT Article 33(3) with respect to inventive step.</p> <p>7. Claims 2-11 are dependent on claim 1 and therefore likewise meet the PCT requirements for inventive step.</p>
